Graphs for one step inference:

Fashion MNIST

Findings:

When changing the hyper parameters from SGD to ADAM, I observed that ADAM has better performance when compared to SGD when we are considering categorical_crossentropy as a loss equation.

Instead of mean squares using categorical_crossentropy would help to increase the performance of the model as there are 10 categories of MNIST.

Adding the drop out and L2 regularization, I observed that there is drop when using L2 and boost in performance when using drop out.

As part of the hyper-parameter optimization, I changed the batch sizes to 24,32 etc and used a different learning rate for adam.
